The switch automatically negotiates trunked links between LACP-configured ports on separate devices, and offers one dynamic trunk option: LACP. To configure the switch to initiate a dynamic LACP trunk with another device, use the interface command in the CLI to set the default LACP option to active on the ports you want to use for the trunk.

Port trunking allows you to assign physical links to one logical link (trunk) that functions as a single, higher-speed link providing dramatically increased bandwidth. This capability applies to connections between backbone devices as well as to connections in other network areas where traffic bottlenecks exist.

In our example, the Switch port 40 was configured as a trunk. The following Vlan were allowed to use this port as a trunk: 1, 100 and 200. Vlan 1 is the default native VLAN of HP Switches. Don't forget to save your HP switch trunk configuration.

For most installations, HP Switch recommends that you leave the port mode settings at Auto (the default). LACP also operates with Auto-10, Auto-100, and Auto-1000 (if negotiation selects FDx), and 10FDx, 100FDx, and 1000FDx settings. LACP trunk status commands include:

Remember with HP a Trunk is adding together lots of links, (if you 're a Cisco head think of port-channeling). So here we create a trunk, then use that trunk to pass tagged VLAN traffic across the switches.

On an HP switch, the individual ports are rarely configured directly. Instead, the VLAN itself is configured and the ports are added to the VLAN configuration. In order to setup an access port, it is configured as an untagged member of the VLAN it needs to belong to. Since HP does not support ISL trunking, the terminology is straight from 802.1q.

In computer networking, the term link aggregation refers to various methods of combining (aggregating) multiple network connections in parallel in order to increase throughput beyond what a single connection could sustain, and to provide redundancy in case one of the links should fail. A link aggregation group (LAG) is the collection of physical ports combined together.

On the HP, you are connecting to port 1 and port g0/24 on the Cisco (just to keep things easier to determine which switch we are talking about). The default VLAN will be 20 and you will trunk VLANs 25, 30, and 40. I haven't worked specifically with the 3400CL, but this should be close, although port numbers may vary.

Go beyond layer 2 broadcast domains with this in-depth tour of advanced link and internetwork layer protocols, and learn how they enable you to expand to larger topologies. An ideal follow-up to Packet Guide to Core Network Protocols, this concise guide dissects several of these protocols to explain their structure and operation. This isn't a book on packet theory. Author Bruce Hartpence built topologies in a lab as he wrote this guide, and each chapter includes several packet captures. You'll learn about protocol classification, static vs. dynamic topologies, and reasons for installing a particular route. This guide covers: Host routing—Process a routing table and learn how traffic starts out across a network Static routing—Build router routing tables and

"Now that virtualization has blurred the lines between networking and servers, many VMware specialists need a stronger understanding of networks than they may have gained in earlier IT roles. Networking for VMware administrators fills this crucial knowledge gap. Writing for VMware professionals, Christopher Wahl and Steve Pantol illuminate the core concepts of modern networking, and show how to apply them in designing, configuring, and troubleshooting any virtualized network environment"--P.
